**DIP Switch Toggles – Default OFF (for Auto-setup, see next page)**

Before installing the units, find the scenario you are using in the table below and set the DIP switch toggles accordingly. Toggle #4 is reserved for future functionality.

For standalone pair upgrades, set Toggles #1-2-3 to ON and connect one unit to Controller.

* Connect ICS LAN port of DXLink fiber unit to network device (e.g., laptop, IP controlled projector, ICSlan Device). In standalone setup, connect ICS LAN port of other DXLink unit to network.

** In standalone setup using NetLinx control of DXLink serial/IR ports, only one of the DXLink fiber units should be connected to network (the unit with #1 Toggle enabled).

---

**Overview**

The DXFP-TX-4K60 and DXFP-RX-4K60 transmit HDMI, audio, USB and control over fiber optic cable. The TX also has an HDMI loop out. DXLink fiber modules can be set up in one of three ways:

- **Endpoint Mode (Switcher)** – connect one or more to a switcher with an integrated Controller.
- **Endpoint Mode (Standalone)** – connect TX/RX pair directly to each other with one connected to a NetLinx Central Controller via LAN or directly to Controller.
- **Extender Mode (Standalone)** – connect TX/RX pair directly to each other.

These Modules support InstaGate Pro® and SmartScale® Technology. The Hardware Reference Manual - DXLink 4K60 Fiber Transmitter/Receiver contains complete documentation (including full specifications and supported input and output resolutions), for details, see www.amx.com.

---

**System Setup**

The DXFP-TX-4K60 and DXFP-RX-4K60 work with a switcher that supports DXLink Technology or as a stand-alone pair to transmit audio, video and control signals. The Transmitter receives audio and video from the HDMI source and transmits both audio and video over the fiber optic cable. This DXLink fiber optic cable can be routed directly to a DXLink fiber receiver or to a DXLink fiber input on a DXLink switcher where it can be routed to a DXLink fiber output and connected to a DXLink fiber receiver. The DXLink fiber receiver converts the DXLink fiber input to HDMI and analog audio outputs. On the transmitter, stereo audio connections are provided as a supplemental audio input. Both the transmitter and the receiver support RS-232 for serial data transfer, USB, IR, and Ethernet.

---

**Mounting Options (Rack Trays and Mounting Brackets)**

The DXFP-TX-4K60 and DXFP-RX-4K60 can be mounted using V Style Surface Mounting Brackets, V Style Single Module Pole Mounting Kit, or NMX-VRK V-Style Rack Shelf. For details, see www.amx.com.

**ICSLAN 10/100 Port**

The ICSLAN 10/100 port uses twisted pair cable. FIG. 4 shows the LEDs for this port.

**Fiber Optic Transceivers**

The DXLink Fiber Transmitters and Receivers use SFP+ fiber optic transceivers. Fiber optic transceivers are self-contained modules that send and receive optical signals over fiber cable. DXLink SFP+ fiber optic transceivers is multimode and must be wired with the corresponding cable type. **Multimode transceivers support bidirectional and unidirectional communication.**

**Attaching Signal, Transport, and Control Cables**

**Important Cabling Requirements and Considerations**

- Fiber optic cable with LC termination for snap coupling with SFP+ transceivers
- LC Duplex conforming to ANSI/TIA-568-C.2-CDRH requirements. While the Class 1 category indicates that the invisible laser used is safe, we recommend avoiding direct eye exposure when using any optical fiber products (See OSHA directive referenced in the “Hardware Reference Manual”).

---

**WARNING**: DXLink Fiber units use laser transceiver, which are Class 1 Eye Safe per IEC 60825-1/CDRH requirements. While the Class 1 category indicates that the invisible laser used is safe, we recommend avoiding direct eye exposure when using any optical fiber products.
To attach signal, transport, and control cables to the Transmitter:
1. Set DIP switch toggles if necessary (for settings, see the previous page).
2. HDMI In – Attach an HDMI cable from the source to the HDMI In connector.
3. DXLink Fiber Output - Attach a fiber cable to the DXLink fiber output port and to a DXLink fiber input connector on the switcher (or on the RX for a standalone pair).
4. Stereo Audio In jack (optional) – Insert analog audio cable from source.
5. HDMI Output (optional) – Insert an HDMI cable from port to HDMI Out connector.
6. ICS LAN10/100 port (optional) – Use to attach twisted pair cable to LAN.

To attach signal, transport, and control cables to the Receiver:
1. Plug the cord from the desktop power supply (provided) into the power jack on the front of the unit.
2. Plug the desktop power supply into an AC external power source. The Power LED on the front of the unit illuminates green, indicating a ready state.

Applying Power
A desktop power supply (ENERGY STAR® qualified) is provided with each TX and RX. CAUTION: The provided desktop power supply must be used to power the DXLink Fiber TX and RX, and it must not be altered in any way.

To apply power to the Transmitter and/or Receiver:
1. Plug the cord from the desktop power supply (provided) into the power jack on the front of the unit (2.1 mm DC jack for 12 V local power).
2. Plug the desktop power supply into a AC external power source. The Power LED on the front of the unit illuminates green, indicating a ready state.

DXLink Auto-setup with Enova DGX 100 Series Switchers
Auto-setup is the default for using DXLink Modules with Enova DGX 100 Series Switchers. When all of the following conditions are met, the modules automatically go into Auto-setup Mode and can communicate through the ICS LAN port with the integrated Controller:

- Endpoints must be set to DHCP Mode (default) and use the NDP connection mode (default).
- Endpoints must not be bound to a Controller.

IMPORTANT: On the switcher, the ICS LAN port acts as a DHCP server (private LAN) and the LAN 100/1000 port acts as a DHCP client (public LAN) with each port on a separate network. In order to avoid a Network Loop, do not connect any device on the private network to any branch on the public network.

IP Addressing Modes
DHCP Mode (enabled when #3 Toggle is flipped ON)
In DHCP Mode, the Module attempts to get a DHCP lease (consisting of an IP address, gateway, and other network parameters). If the attempt fails, the Module configures itself for a link-local address, but periodically re-tries DHCP and re-assigns the IP to a valid DHCP grant if successful. At any time, if the Module determines that its IP address has changed, it will disconnect and reconnect to the Controller.

Static IP Mode (set with ID button or Telnet command)
With #3 Toggle set to ON, press ID for 10 seconds to assign address or use a Telnet command to set static IP Mode (see the manual).

Enova DGX and DXLink Fiber IP Setup (system without auto-setup)
To setup DXLink fiber Modules with an Enova DGX without auto-setup, you must configure the Device ID for each connected DXLink fiber module and then connect (bind) the modules to the DGX unit. Complete instructions for DXLink fiber setup on systems that don't support auto-setup can be found in the Hardware Reference Manual – DXLink 4K60 Fiber Transmitter/Receiver.

RS-232 Serial Data (Optional)
The 232 port label is relative to data flow. Data enters at RX label on the Transmitter, is sent via a fiber optic cable through the switcher, and leaves at TX label on Receiver. Flow is vice versa from Receiver to Transmitter. Applies to all DXLink fiber modules - wire RS-232 port for serial data transfer according to pinout above.

IR Control (Optional)
The IR Receiver connects to the IR RX port on the Transmitter and the IR Emitter connects to the IR TX port on the Receiver or vice versa, depending on the installation. The signal is sent via DXLink fiber optic cable through the switcher.

Configuring and Using USB Ports
1. Each TX and RX has a Host Port (USB-B) and a Device Port (USB-A), but only one port is active at a time depending on the position of the USB DIP Switch.
2. The active USB port is set by the USB DIP Switch on the front panel of the TX/RX.
3. Set the USB Mode to Host when connecting to a USB host like a PC. Set the USB Mode to Device when connecting to USB devices like keyboards, mice or cameras.
4. When connecting to a DGX DXLink 4K60 Fiber input/output board, the DGX will automatically detect the setting on the TX/RX and will set the function of the associated Micro-USB A/B port accordingly.
5. Some USB2.0 devices can only be powered by the TX/RX USB port when the TX/RX is powered via the local power connector.

Note:
- A reboot is required for changes to the USB Mode switch to take effect.
- USB ports can also be used to upgrade firmware. See Hardware Reference.
- When a TX and RX are connected point-to-point, the USB mode switches on the TX and RX cannot be set to the same mode.

ID Button (Front)
The ID button on the front can be used to toggle between static and DHCP IP address, assign a device address, reset the factory defaults, and restore the factory firmware image (for details, see the manual).

Additional Information Covered in Manual
For information on the following, see the Hardware Reference Manual - DXLink 4K60 Fiber Transmitter/Receiver at www.amx.com:
- NetLinx control and programming commands; Telnet commands;
- IR file transfers; upgrading firmware image; restoring factory default settings;
- Web UI configurations.
